

Command-prompt program for easy data retrieval and remote configuration

Top Features:

- › Remote STC configurations
- › Low Resources
- › Multiple export options

Compatible with:

- › STC-U200
- › STC-W200
- › STC-U100
- › STC-B100
- › STC-052/108/112/312
- › Windows 2000, XP, 2003, Vista, 2008, 7

TMS Basic is a small executable program that uses keys and functions to communicate different commands to the STC.

Ideal for command-prompt type script, this software is best used as a way to get traffic out of the STC and put into a file for easy importation in another system, either a third-party or TMS Enterprise or Controller.

Remote STC configuration

Using TMS Basic it is possible to change the different configuration of the STCs remotely. Items such as password, labels, interval and much more can be changed remotely without any assistance at the site.

Low resources

Since the application needs to be launched manually or by a batch script process and will only use your system resources during the communication process, you don't have to be concerned about the stability of your system.

Multiple export option

XML, CSV and backward compatibility with STC ASCII file format for all previous models.
